

COMPUTER SCIENCE

1st Semester

The purpose of the 1st semester is to provide students with personal and discipline-related qualifications that are closely related.

In terms of discipline-related skills, it is the intention that students gain an insight into:

- Activities related to system development
- Basic programming
- Basic computer science methods, techniques and tools
- Organisational matters relevant to the development/implementation of IT systems.

The short term goal for personal qualifications is to enable you to take part in creating a good team spirit and student environment in your class. The long term goal is for you to develop into someone who makes independent assessments and decisions and who develops solutions in cooperation with others.
