

COMPUTER SCIENCE

Final semester

The final semester comprises two educational components: the internship and the final degree project, each worth 15 ECTS. The purpose of the internship is to develop the students' practical competencies and skills. During the internship, the students will apply methods, theories and tools learnt during studies for solving specific practical information-technology tasks. For the final project the students must document their understanding of theories and methods in relation to a practise-related problem. The problem will be based on a specific IT task, if possible in collaboration with a private or public company.
